

# Breast metastatic trastuzumab three weekly

ID: 33 v.7   **Endorsed**   Essential Medicine List

Check for clinical trials in this patient group. Link to [Australian Clinical Trials](#) website

The anticancer drug(s) in this protocol may have been included in the ADDIKD guideline. Dose recommendations in kidney dysfunction have yet to be updated to align with the ADDIKD guideline. Recommendations will be updated once the individual protocol has been evaluated by the reference committee. For further information refer to the ADDIKD guideline. To assist with calculations, use the [eviQ Estimated Glomerular Filtration Rate \(eGFR\) calculator](#).

## International Consensus Guideline for Anticancer Drug Dosing in Kidney Dysfunction (ADDIKD)

2022

## Treatment schedule - Overview

### Cycle 1

Drug	Dose	Route	Day
Trastuzumab	8 mg/kg (loading dose only)	IV infusion *	1

### Cycle 2 and further cycles

Drug	Dose	Route	Day
Trastuzumab	6 mg/kg (subsequent doses)	IV infusion *	1

\*Trastuzumab is available as a subcutaneous formulation administered at a dose of 600 mg every three weeks. Subcutaneous trastuzumab has a similar safety profile to intravenous trastuzumab and is non-inferior in terms of pharmacokinetic profile and efficacy and therefore is a valid alternative route of administration compared to standard intravenous trastuzumab. Link to [Breast trastuzumab subcutaneous](#) protocol

**Frequency:** 21 days

**Cycles:** Continuous until disease progression or unacceptable toxicity

**Drug status:** Trastuzumab is [PBS authority](#)

Trastuzumab is available in **150 mg** and **60 mg** vials.

**Cost:** ~ \$420 per cycle

## Treatment schedule - Detail

*The supportive therapies (e.g. antiemetics, premedications, etc.), infusion times, diluents, volumes and routes of administration, if included, are listed as defaults. They may vary between institutions and can be substituted to reflect individual institutional policy.*

*Antiemetics if included in the treatment schedule are based upon recommendations from national and international guidelines. These are*

## Cycle 1

Day 1		
Trastuzumab	8 mg/kg (IV infusion)	in 250 mL sodium chloride 0.9% over 90 minutes (loading dose; cycle 1 only)*

## Cycle 2 and further cycles

Day 1		
Trastuzumab	6 mg/kg (IV infusion)	in 250 mL sodium chloride 0.9% over 30 minutes (if the initial loading dose was well tolerated)*

\*Trastuzumab is available as a subcutaneous formulation administered at a dose of 600 mg every three weeks. Subcutaneous trastuzumab has a similar safety profile to intravenous trastuzumab and is non-inferior in terms of pharmacokinetic profile and efficacy and therefore is a valid alternative route of administration compared to standard intravenous trastuzumab. Link to [Breast trastuzumab subcutaneous protocol](#)

**Frequency:** 21 days

**Cycles:** Continuous until disease progression or unacceptable toxicity

## Indications and patient population

### Indication:

- HER-2 positive metastatic breast cancer, as monotherapy, in patients who have received one or more chemotherapy regimen(s) for metastatic disease
  - HER-2 positive as demonstrated by in situ hybridisation (ISH)

### Caution:

- left ventricular ejection fraction (LVEF) of 45% or less.

## Clinical information

<b>Venous access required</b>	IV cannula (IVC) or central venous access device (CVAD) is required to administer this treatment. Read more about <a href="#">central venous access device line selection</a>
<b>Hypersensitivity/infusion related reaction</b>	Although hypersensitivity with trastuzumab is common, severe hypersensitivity reactions are uncommon. Use with caution in patients with dyspnoea at rest from pulmonary/cardiac conditions as increased risk of infusion related symptoms.
<b>Premedication</b>	Premedication only required if patient has had a previous hypersensitivity reaction and should be based on clinical judgement.
<b>Emetogenicity MINIMAL</b>	No antiemetics should be routinely administered before treatment in patients without a history of nausea and vomiting. If patients experience nausea and/or vomiting, consider using the low antiemetic prophylaxis regimen. Read more about <a href="#">preventing anti-cancer therapy induced nausea and vomiting</a>

<b>Cardiac toxicity associated with HER-2 directed agents</b>	<p>Patients receiving HER-2 directed agents are at an increased risk of cardiotoxicity e.g. asymptomatic decrease in the left ventricular ejection fraction (LVEF) and congestive heart failure (CHF).</p> <p>In patients with a LVEF less than 45% and/or symptomatic heart failure HER-2 directed therapy should be avoided, except in the metastatic setting when breast cancer is life-threatening and where a cardiologist is also involved.</p> <p>Concurrent anthracycline and HER-2 directed therapy is not recommended for extended periods of time.</p> <p>Baseline and 3 monthly cardiac function tests are required during treatment. In the metastatic setting, after the first 12 months of therapy, if there are no cardiac complications, the frequency of cardiac assessments may be reduced at the discretion of the treating clinician unless there has been recent exposure to anthracyclines.</p> <p>Read more about <a href="#">cardiac toxicity associated with HER-2 targeted agents</a></p>
<b>Biosimilar drug</b>	Read more about biosimilar drugs on the <a href="#">Biosimilar Awareness Initiative</a> page
<b>Blood tests</b>	Routine blood tests are not required for trastuzumab monotherapy. If trastuzumab is given in combination with chemotherapy, refer to the blood tests required for that chemotherapy regimen.
<b>Hepatitis B screening and prophylaxis</b>	<p>Routine screening for HBsAg and anti-HBc is NOT usually recommended for patients receiving this treatment.</p> <p>Read more about <a href="#">hepatitis B screening and prophylaxis in cancer patients requiring cytotoxic and/or immunosuppressive therapy</a></p>
<b>Vaccinations</b>	<p>Live vaccines are contraindicated in cancer patients receiving immunosuppressive therapy and/or who have poorly controlled malignant disease.</p> <p>Refer to the recommended schedule of vaccination for immunocompromised patients, as outlined in the <a href="#">Australian Immunisation Handbook</a>.</p> <p>Read more about <a href="#">COVID-19 vaccines and cancer</a>.</p>
<b>Fertility, pregnancy and lactation</b>	<p>Cancer treatment can have harmful effects on fertility and this should be discussed with all patients of reproductive potential prior to commencing treatment. There is a risk of foetal harm in pregnant women. A pregnancy test should be considered prior to initiating treatment in females of reproductive potential if sexually active. It is important that all patients of reproductive potential use effective contraception whilst on therapy and after treatment finishes. Effective contraception methods and adequate contraception timeframe should be discussed with all patients of reproductive potential. Possibility of infant risk should be discussed with breastfeeding patients.</p> <p>Read more about the <a href="#">effect of cancer treatment on fertility</a></p>

## Dose modifications

*Evidence for dose modifications is limited, and the recommendations made on eviQ are intended as a guide only. They are generally conservative with an emphasis on safety. Any dose modification should be based on clinical judgement, and the individual patient's situation including but not limited to treatment intent (curative vs palliative), the anti-cancer regimen (single versus combination therapy versus chemotherapy versus immunotherapy), biology of the cancer (site, size, mutations, metastases), other treatment related side effects, additional co-morbidities, performance status and patient preferences. Suggested dose modifications are based on clinical trial findings, product information, published guidelines and reference committee consensus. The dose reduction applies to each individual dose and not to the total number of days or duration of treatment cycle unless stated otherwise. Non-haematological gradings are based on [Common Terminology Criteria for Adverse Events \(CTCAE\)](#) unless otherwise specified. Renal and hepatic dose modifications have been standardised where possible. For more information see dosing considerations & disclaimer.*

The dose recommendations in kidney dysfunction (i.e. renal impairment) displayed may not reflect those in the ADDIKD guideline and have been included for historical reference only. Recommendations will be updated once the individual protocol has been evaluated by the reference committee, with this version of the protocol then being archived. Clinicians are expected to

refer to the ADDIKD guideline prior to prescribing in kidney dysfunction.

### International Consensus Guideline for Anticancer Drug Dosing in Kidney Dysfunction (ADDIKD).

#### Renal impairment

No dose modifications necessary

#### Hepatic impairment

No dose modifications necessary

#### Cardiac toxicity

Consider referral to a cardiologist if any of the following occur

LVEF less than 45%	Delay trastuzumab. Repeat LVEF assessment within 3 weeks Consider discontinuing trastuzumab if LVEF less than 45% is confirmed
--------------------	---

Symptomatic heart failure	Consider discontinuing trastuzumab
---------------------------	------------------------------------

#### Missed doses of trastuzumab

By 6 weeks or less	No dose modification necessary Give trastuzumab as soon as possible, i.e. do not wait until the next planned cycle
--------------------	---

By more than 6 weeks	Reload trastuzumab with a dose of 8 mg/kg Subsequent doses of 6 mg/kg should then be given every 3 weeks, according to the previous cycle However, if the delay was due to cardiac toxicity, clinician may choose not to reload the patient
----------------------	---

## Interactions

Drug interactions in eviQ protocols are under review and being updated to align with current literature. Further site-wide updates and changes will occur in due course. *References & Disclaimer*

The drug interactions shown below are not an exhaustive list. For a more comprehensive list and for detailed information on specific drug interactions and clinical management, please refer to the specific drug product information and the following key resources:

- [MIMS - interactions tab](#) (includes link to a CYP-450 table) (login required)
- [Australian Medicines Handbook \(AMH\) – interactions tab](#) (login required)
- [Micromedex Drug Interactions](#) (login required)
- [Cancer Drug Interactions](#)
- [Cytochrome P450 Drug Interactions](#)

#### Trastuzumab

	Interaction	Clinical management
<b>Cardiotoxic drugs (e.g. anthracyclines cyclophosphamide)</b>	Additive cardiotoxicity	Monitor cardiac function closely in patients who have previously been treated with cumulatively cardiotoxic drugs
<b>Paclitaxel</b>	Increased toxicity of trastuzumab possible due to reduced clearance	Monitor for trastuzumab toxicity (esp. cardiotoxicity)

General		
	Interaction	Clinical management
<b>Warfarin</b>	Anti-cancer drugs may alter the anticoagulant effect of warfarin.	Monitor INR regularly and adjust warfarin dosage as appropriate; consider alternative anticoagulant.
<b>Direct oral anticoagulants (DOACs) e.g. apixaban, rivaroxaban, dabigatran</b>	<p>Interaction with both CYP3A4 and P-gp inhibitors /inducers.</p> <p>DOAC and anti-cancer drug levels may both be altered, possibly leading to loss of efficacy or toxicity (i.e. increased bleeding).</p>	<p>Apixaban: avoid concurrent use with strong <a href="#">CYP3A4</a> and <a href="#">P-gp</a> inhibitors. If treating VTE, avoid use with strong <a href="#">CYP3A4</a> and <a href="#">P-gp</a> inducers.</p> <p>Rivaroxaban: avoid concurrent use with strong <a href="#">CYP3A4</a> and <a href="#">P-gp</a> inhibitors.</p> <p>Dabigatran: avoid combination with strong <a href="#">P-gp</a> inducers and inhibitors.</p> <p>If concurrent use is unavoidable, monitor closely for efficacy/toxicity of both drugs.</p>
<b>Digoxin</b>	Anti-cancer drugs can damage the lining of the intestine; affecting the absorption of digoxin.	Monitor digoxin serum levels; adjust digoxin dosage as appropriate.
<b>Antiepileptics</b>	Both altered antiepileptic and anti-cancer drug levels may occur, possibly leading to loss of efficacy or toxicity.	Where concurrent use of an enzyme-inducing antiepileptic cannot be avoided, monitor antiepileptic serum levels for toxicity, as well as seizure frequency for efficacy; adjust dosage as appropriate. Also monitor closely for efficacy of the anti-cancer therapy.
<b>Antiplatelet agents and NSAIDs</b>	Increased risk of bleeding due to treatment related thrombocytopenia.	Avoid or minimise combination. If combination deemed essential, (e.g. low dose aspirin for ischaemic heart disease) monitor for signs of bleeding.
<b>Serotonergic drugs, including selective serotonin reuptake inhibitors (SSRIs e.g. paroxetine) and serotonin noradrenaline reuptake inhibitors (SNRIs e.g. venlafaxine)</b>	Increased risk of serotonin syndrome with concurrent use of 5-HT <sub>3</sub> receptor antagonists (e.g. palonosetron, ondansetron, granisetron, tropisetron, dolasetron, etc.)	<p>Avoid combination.</p> <p>If combination is clinically warranted, monitor for signs and symptoms of serotonin syndrome (e.g. confusion, agitation, tachycardia, hyperreflexia). For more information link to <a href="#">TGA Medicines Safety Update</a></p>
<b>Vaccines</b>	Diminished response to vaccines and increased risk of infection with live vaccines.	<p>Live vaccines (e.g. BCG, MMR, zoster and varicella) are contraindicated in patients on immunosuppressive therapy. Use with caution in patients on non-immunosuppressive therapy.</p> <p>For more information; refer to the recommended schedule of vaccination for cancer patients, as outlined in the <a href="#">Australian Immunisation Handbook</a></p>

## Administration

*eviQ provides safe and effective instructions on how to administer cancer treatments. However, eviQ does not provide every treatment delivery option, and is unable to provide a comprehensive list of cancer treatment agents and their required IV line giving set/filter. There may be alternative methods of treatment administration, and alternative supportive treatments that are also appropriate. Please refer to the individual*

## Day 1

**Approximate treatment time: 2 hours (initial); 1 hour (subsequent)**

Handling of monoclonal antibodies and waste management

Safe administration

General patient assessment prior to each day of treatment.

Any toxicity grade 2 or greater may require delay of treatment and review by medical officer before commencing treatment.

Prime IV line(s).

Insert IV cannula or access [TIVAD](#) or [CVAD](#).

### Pre treatment medication

Administer premedication only if previous hypersensitivity reaction.

## 🕒 Treatment - Time out

### Trastuzumab

- Trastuzumab is incompatible with glucose solutions. Ensure IV administration sets are flushed with sodium chloride 0.9% pre and post administration.

#### Initial infusion - administer trastuzumab:

- via IV infusion over 90 minutes
- observe patient for fever and chills or other infusion-related symptoms
- flush with ~50 mL of sodium chloride 0.9%
- stop infusion at first sign of reaction:
  - if symptoms are mild and resolve when infusion is stopped, consider recommencing infusion after review by medical officer at a slower rate
  - for severe reactions seek medical assistance immediately and do not restart infusion
- educate the patient about the possibility of delayed infusion-related symptoms.

#### Subsequent infusions - administer trastuzumab:

- if no previous hypersensitivity reaction administer via IV infusion over 30 minutes
- observe patient for fever and chills or other infusion-related symptoms
- flush with ~ 50 mL of sodium chloride 0.9%
- stop infusion at first sign of reaction:
  - if symptoms are mild and resolve when infusion is stopped, consider recommencing infusion after review by medical officer at a slower rate
  - for severe reactions seek medical assistance immediately and do not restart infusion
- educate the patient about the possibility of delayed infusion-related symptoms.

Remove IV cannula and/or deaccess [TIVAD](#) or [CVAD](#).

## Discharge information

### Patient information

- Ensure patient receives patient information sheet.

## Side effects

*The side effects listed below are not a complete list of all possible side effects for this treatment. Side effects are categorised into the approximate onset of presentation and should only be used as a guide.*

Immediate (onset hours to days)	
<b>Hypersensitivity reaction</b>	Anaphylaxis and infusion related reactions can occur with this treatment. Read more about <a href="#">hypersensitivity reaction</a>
<b>Flu-like symptoms</b>	
<b>Headache</b>	
Early (onset days to weeks)	
<b>Diarrhoea</b>	Read more about <a href="#">treatment induced diarrhoea</a>
<b>Fatigue</b>	Read more about <a href="#">fatigue</a>
<b>Nausea and vomiting</b>	Read more about <a href="#">prevention of treatment induced nausea and vomiting</a>
Late (onset weeks to months)	
<b>Pulmonary toxicity</b>	Pulmonary toxicity may include damage to the lungs, airways, pleura and pulmonary circulation. Read more about <a href="#">pulmonary toxicity associated with anti-cancer drugs</a>
Delayed (onset months to years)	
<b>Cardiotoxicity</b>	Cardiotoxicity is a well recognised complication of HER-2 directed agents (e.g. trastuzumab, trastuzumab emtansine, pertuzumab). Mechanistically distinct from anthracycline-induced cardiotoxicity, it typically manifests as an asymptomatic decrease in the left ventricular ejection fraction (LVEF) and less commonly as congestive heart failure (CHF). Read more about <a href="#">cardiac toxicity associated with HER-2 targeted agents</a>

## Evidence

The standard administration of trastuzumab has been as a weekly infusion in HER-2 positive patients with metastatic breast cancer.

Retrospective analysis of pharmacokinetics data for weekly trastuzumab indicated that the half-life of trastuzumab is approximately 28.5 days<sup>1</sup> and trastuzumab given 3 weekly at a dose of 6mg/kg demonstrated similar exposure to the weekly regimen. The only difference being that the peak levels were higher (up to 70%) and the trough levels were lower (by up to 20%).<sup>2</sup>

A multicenter, phase II study by Baselga 2005 found that trastuzumab monotherapy administered on a 3 weekly schedule (loading dose 8mg/kg followed by 6mg/kg) in HER-2 positive MBC women did not compromise the efficacy or safety.<sup>3</sup>

### Efficacy

A total of 105 patients were enrolled into the study and received a median of 5 cycles of therapy.

The overall response rate was 19% and clinical benefit rate (complete and partial responses plus stable disease for at least 6 months) was 33%.

Median time to progression was 3.4 months.<sup>3</sup>

### Response<sup>3</sup>

<b>Table 2.</b> Response to First-Line 3-Weekly Trastuzumab Monotherapy		
Response	No. of Patients (n = 105)*	
	No.	%
CR	2	2
PR	18	17
SD	53	51†
CBR (CR + PR + SD > 6 months)	35	33
PD	30	29
ORR (ITT)	20	19†

Abbreviations: CR, complete response; PR, partial response; SD, stable disease; CBR, clinical benefit rate; PD, progressive disease; ORR, overall response rate; ITT, intent-to-treat population.  
 \*Data missing for two patients.  
 †One patient with a best response of SD in the main study period achieved CR in the 12-month follow-up period. Therefore, in the follow-up analysis, ORR was 20%.

© Journal of Clinical Oncology 2005

## Response<sup>3</sup>

<b>Table 3.</b> Response to 3-Weekly First-Line Trastuzumab Monotherapy in Patients With Measurable Centrally Confirmed IHC 3+ or (local or central) FISH-Positive Disease		
Response	PPS No. of Patients (n = 83)*	
	No.	%
CR	2	2
PR	17	21
SD	42	51
CBR (CR + PR + SD > 6 months)	30	36
PD	21	25
ORR (PPS)	19	23

Abbreviations: IHC, immunohistochemistry; FISH, fluorescence in situ hybridization; PPS, per protocol subset; CR, complete response; PR, partial response; SD, stable disease; CBR, clinical benefit rate; PD, progressive disease; ORR, overall response rate.  
 \*Data missing for one patient.

© Journal of Clinical Oncology 2005

## Toxicity

The most common treatment-related adverse events were mild to moderate rigors, pyrexia, headache, nausea, and fatigue occurring mostly in the first cycle.

The median baseline LVEF of 63% did not change significantly over the course of the study. Only one patient experienced symptomatic cardiac failure which resolved with cessation of trastuzumab and symptomatic management. Decreases in LVEF were more frequent and more severe in patients with prior anthracycline therapy.<sup>3</sup>

## Adverse Events<sup>3</sup>

<b>Table 4.</b> Most Common Treatment-Related Adverse Events (n = 105)		
Adverse Event	No. of Patients	
	No.	%
Rigors	19	18
Pyrexia	16	15
Headache	11	10
Nausea	10	10
Fatigue	10	10

## History

### Version 7

Date	Summary of changes
16/11/2021	Pulmonary toxicity added to side effects. Version number changed to V.7.

### Version 6

Date	Summary of changes
04/05/2020	Trastuzumab subcutaneous formulation note added to treatment schedule overview and detail sections. Biosimilar trastuzumab added to clinical information. ID 1875 Breast trastuzumab subcutaneous added as a related page. Approximate treatment time changed to 2 hours (initial), 1 hour (subsequent). Version number changed to V.6.

### Version 5

Date	Summary of changes
04/10/2019	Dose modification missed dose cutoff changed to 6 weeks, cardiac toxicity dose modification added. Version number changed to V.5. Next review in 5 years.

### Version 4

Date	Summary of changes
28/03/2007	Dose vial recommendations added.
07/12/2007	Option of rapid administration added.
04/08/2009	Review and transferred to eviQ.
17/01/2011	New format to allow for export of protocol information. Protocol version number changed to V.2. Antiemetics and premedications added to the treatment schedule. Additional Clinical Information, Key Prescribing table and Key Administration table combined into new section titled Clinical Considerations. Drug specific information placed behind the drug name link.
08/03/2011	Febrile neutropenia removed from PHC view.
27/04/2012	Protocol reviewed at Medical Oncology Reference Committee meeting and next review in 2 years. Added line under dose mods "However, if the delay was due to cardiac toxicity, clinician may choose not to re-load the patient.", as per RCM.
02/12/2013	Dose recommendation table for trastuzumab removed.
08/05/2014	Safe handling precautions (waste) removed.
09/05/2014	Protocol reviewed by email survey. No change and next review in 2 years. PHC view removed.

Date	Summary of changes
18/02/2016	Discussion with Medical Oncology Reference Committee Chairs and protocol to be reviewed every 5 years. Next review due in 3 years.
24/03/2017	Consensus of the Medical Oncology Reference Committee (via email discussion) to remove observation time frames from all trastuzumab protocols and replace with the statement "Observe patient for fever and chills or other infusion-related symptoms" as per current trastuzumab product information. Individual institutions may still implement/maintain local policies on monitoring time frames if they choose to do so.
28/03/2017	Per consensus at the 2016 eviQ Breast Reference Committee meeting, retrospectively added "Caution: left ventricular ejection fraction (LVEF) of 45% or less" to the Indications and patient population section in all trastuzumab protocols.
31/05/2017	Transferred to new eviQ website. Version number change to V.4.  Hepatitis B screening changed to NOT recommended.

The information contained in this protocol is based on the highest level of available evidence and consensus of the eviQ reference committee regarding their views of currently accepted approaches to treatment. Any clinician (medical oncologist, haematologist, radiation oncologist, medical physicist, radiation therapist, pharmacist or nurse) seeking to apply or consult this protocol is expected to use independent clinical judgement in the context of individual clinical circumstances to determine any patient's care or treatment. While eviQ endeavours to link to reliable sources that provide accurate information, eviQ and the Cancer Institute NSW do not endorse or accept responsibility for the accuracy, currency, reliability or correctness of the content of linked external information sources. Use is subject to eviQ's disclaimer available at [www.eviQ.org.au](http://www.eviQ.org.au)

**First approved:** 15 February 2006  
**Last reviewed:** 30 August 2019  
**Review due:** 31 December 2024

# Patient information - Breast cancer metastatic - Trastuzumab three weekly

Patient's name:

## Your treatment

The treatment schedule below explains how the drug for this treatment is given.

Trastuzumab			
This treatment cycle is repeated every 21 days. Your doctor will advise you of the number of treatments you will have.			
Day	Treatment	How it is given	How long it takes
1	<b>Trastuzumab</b> ( <i>tras-TOOZ-ue-mab</i> )	By a drip into a vein	About 2 hours for the first treatment. If no reactions, subsequent treatment may be given over a shorter amount of time e.g. 1 hour

## When to get help

Anticancer drugs (drugs used to treat cancer) can sometimes cause serious problems. It is important to get medical help immediately if you become unwell.

 <b>IMMEDIATELY go to your nearest hospital Emergency Department, or contact your doctor or nurse if you have any of the following at any time:</b>	<b>Emergency contact details</b> Ask your doctor or nurse from your treating team who to contact if you have a problem
<ul style="list-style-type: none"><li>• a temperature of 38°C or higher</li><li>• chills, sweats, shivers or shakes</li><li>• shortness of breath</li><li>• uncontrolled vomiting or diarrhoea</li><li>• pain, tingling or discomfort in your chest or arms</li><li>• you become unwell.</li></ul>	Daytime:..... Night/weekend:..... Other instructions:..... ..... ..... .....

**During your treatment immediately** tell the doctor or nurse looking after you if you get any of the following problems:

- leaking from the area where the drugs are being given
- pain, stinging, swelling or redness in the area where the drugs are being given or at any injection sites
- a skin rash, itching, feeling short of breath, wheezing, fever, shivers, or feeling dizzy or unwell in any way (allergic reaction).

## Other information about your treatment

### Changes to your dose or treatment delays

Sometimes a treatment may be started at a lower dose or the dose needs to be changed during treatment. There may also be times when your treatment is delayed. This can happen if your doctor thinks you are likely to have severe side effects, if you get severe side effects, if your blood counts are affected and causing delays in treatment, or if you are finding it hard to cope with the

treatment. This is called a dose reduction, dose change or treatment delay. Your doctor will explain if you need any changes or delays to your treatment and the reason why.

## Blood tests and monitoring

You may need to have blood tests while you are receiving this treatment. Your doctor or nurse will tell you when to have these blood tests.

## Side effects

Cancer treatments can cause damage to normal cells in your body, which can cause side effects. Everyone gets different side effects, and some people will have more problems than others.

The table below shows some of the side effects you may get with this treatment. You are unlikely to get all of those listed and you may also get some side effects that have not been listed.

Tell your doctor or nurse about any side effects that worry you. Follow the instructions below and those given to you by your doctor or nurse.

Immediate (onset hours to days)	
Allergic reaction	<ul style="list-style-type: none"><li>• Allergic reactions are uncommon but can be life threatening.</li><li>• <b>If you feel unwell during the infusion or shortly after it, or:</b><ul style="list-style-type: none"><li>◦ <b>get a fever, shivers or shakes</b></li><li>◦ <b>feel dizzy, faint, confused or anxious</b></li><li>◦ <b>start wheezing or have difficulty breathing</b></li><li>◦ <b>have a rash, itch or redness of the face</b></li></ul></li></ul> <p><b><u>While you are in hospital:</u> Tell your doctor or nurse immediately.</b></p> <p><b><u>After you leave:</u> Contact your doctor or nurse immediately, or go to the nearest hospital Emergency Department.</b></p>
Flu-like symptoms	<ul style="list-style-type: none"><li>• You may get:<ul style="list-style-type: none"><li>◦ a fever</li><li>◦ chills or sweats</li><li>◦ muscle and joint pain</li><li>◦ a cough</li><li>◦ headaches.</li></ul></li><li>• Tell your doctor or nurse if you get any of the symptoms listed above.</li><li>• <b>Tell your doctor or nurse immediately, or go to the nearest hospital Emergency Department if you have a temperature of 38°C or higher.</b></li></ul>
Headache	<ul style="list-style-type: none"><li>• You can take paracetamol if you have a headache.</li><li>• <b>Tell your doctor or nurse immediately, or go to the nearest hospital Emergency Department if you get a very bad headache that is not helped by pain medication.</b></li></ul>

Early (onset days to weeks)	
Diarrhoea	<ul style="list-style-type: none"> <li>You may get bowel motions (stools, poo) that are more frequent or more liquid.</li> <li>You may also get bloating, cramping or pain.</li> <li>Take your antidiarrhoeal medication as directed by your doctor.</li> <li>Drink plenty of fluids (unless you are fluid restricted).</li> <li>Eat and drink small amounts more often.</li> <li>Avoid spicy foods, dairy products, high fibre foods, and coffee.</li> <li>Ask your doctor or nurse for eviQ patient information - <a href="#">Diarrhoea during cancer treatment</a>.</li> <li><b>Tell your doctor or nurse immediately, or go to your nearest hospital Emergency Department if your diarrhoea is not controlled, you have 4 or more loose bowel motions per day, and if you feel dizzy or light-headed.</b></li> </ul>
Tiredness and lack of energy (fatigue)	<ul style="list-style-type: none"> <li>You may feel very tired, have no energy, sleep a lot, and not be able to do normal activities or things you enjoy.</li> <li>Do not drive or operate machinery if you are feeling tired.</li> <li>Nap for short periods (only 1 hour at a time)</li> <li>Prioritise your tasks to ensure the best use of your energy.</li> <li>Eat a well balanced diet and drink plenty of fluids (unless you are fluid restricted).</li> <li>Try some gentle exercise daily.</li> <li>Allow your friends and family to help.</li> <li><b>Tell your doctor or nurse if you get any of the symptoms listed above.</b></li> </ul>
Nausea and vomiting	<ul style="list-style-type: none"> <li>You may feel sick (nausea) or be sick (vomit).</li> <li>Drink plenty of fluids (unless you are fluid restricted).</li> <li>Eat small meals more frequently.</li> <li>Try food that does not require much preparation.</li> <li>Try bland foods like dry biscuits or toast.</li> <li>Gentle exercise may help with nausea.</li> <li>Anti-sickness medication is usually not needed but may help in some people.</li> <li>Ask your doctor or nurse for eviQ patient information - <a href="#">Nausea and vomiting during cancer treatment</a>.</li> <li><b>Tell your doctor or nurse immediately, or go to the nearest hospital Emergency Department if you have uncontrolled vomiting or feel dizzy or light-headed.</b></li> </ul>
Late (onset weeks to months)	
Lung problems	<ul style="list-style-type: none"> <li>Lung problems are rare, but can be serious. They may occur throughout treatment or after the completion of treatment.</li> <li>You may get: <ul style="list-style-type: none"> <li>shortness of breath</li> <li>fever</li> <li>dry cough</li> <li>wheezing</li> <li>fast heartbeat</li> <li>chest pain.</li> </ul> </li> <li>Your doctor will monitor how well your lungs are working during your treatment.</li> <li><b>Tell your doctor or nurse immediately, or go to the nearest hospital Emergency Department if you have chest pain or become short of breath.</b></li> </ul>

## Delayed (onset months to years)

### Heart problems

- You may get:
  - chest pain or tightness
  - shortness of breath
  - swelling of your ankles
  - an abnormal heartbeat.
- Heart problems can occur months to years after treatment.
- Tell your doctor if you have a history of heart problems or high blood pressure.
- Before or during treatment, you may be asked to have a test to see how well your heart is working.
- **Tell your doctor or nurse immediately, or go to the nearest hospital Emergency Department if you get any of the symptoms listed above.**

## General advice for people having cancer treatment

### Blood clot risk

- Cancer and anticancer drugs can increase the risk of a blood clot (thrombosis).
- Tell your doctor if you have a family history of blood clots.
- A blood clot can cause pain, redness, swelling in your arms or legs, shortness of breath or chest pain.
- If you have any of these symptoms go to your nearest hospital Emergency Department.

### Medications and vaccinations

- Before you start treatment, tell your doctor about any medications you are taking, including vitamins or herbal supplements.
- Don't stop or start any medications during treatment without talking to your doctor and pharmacist first.
- Paracetamol is safe to take if you have a headache or other mild aches and pains. It is recommended that you avoid taking aspirin, ibuprofen and other anti-inflammatory type medications for pain while you are having treatment. However, if these medications have been prescribed by your doctor, do not stop taking them without speaking with your doctor.
- Vaccinations such as flu and tetanus vaccines are safe to receive while having treatment. Do not have any live vaccines during your treatment or for 6 months after it finishes. If you are unsure, check with your doctor before you have any vaccinations.
- People you live with should be fully vaccinated, including having live vaccines according to the current vaccination schedule. Extra care needs to be taken with hand washing and careful disposal of soiled nappies for infants who have recently received the rotavirus vaccine.

### Other medical and dental treatment

- If you go to hospital or any other medical appointment (including dental appointments), always tell the person treating you that you are receiving anticancer drugs.
- Before you have any dental treatment, talk to your doctor.

### Diet

- While you are receiving this treatment it is important that you try to maintain a healthy diet.
- Speak to your doctor or nurse about whether drinking alcohol is safe with your treatment.
- If you have any concerns about recent weight loss or weight gain or questions about your diet, ask to speak to a dietitian.

### Fertility

- Some cancer treatments can reduce your fertility. This can make it difficult or impossible to get pregnant or father a child.
- Talk to your doctor or nurse before you start any treatment. Depending on your situation there may be fertility sparing options available to you and/or your partner, discuss these with your doctor or nurse.

### Pregnancy and breastfeeding

- Some cancer treatments can be dangerous to unborn babies. Talk to your doctor or nurse if you think there is any chance that you could be pregnant.
- Do not try to get pregnant or father a child during this treatment. Contraception should be used during treatment and after stopping treatment. Ask your doctor or nurse about what type of contraception you should use.
- If you are planning pregnancy/fatherhood after completing this treatment, talk to your doctor. Some doctors advise waiting between 6 months and 2 years after treatment.
- Do not breastfeed if you are on this treatment, as anti-cancer medications can also pass into breast milk.

## Sex life and sexuality

- The desire to have sex may decrease as a result of this treatment or its side effects.
- Your emotions and the way you feel about yourself may also be affected by this treatment.
- It may help to discuss your concerns with your partner and doctor or nurse.

## Quitting smoking

- It is never too late to quit smoking. Quitting smoking is one of the best things you can do to help your treatment work better.
- There are many effective tools to improve your chances of quitting.
- Talk to your treating team for more information and referral to a smoking cessation support service.

## Staying active

- Research shows that exercise, no matter how small, has many benefits for people during and after cancer treatment.
- Talk to your doctor before starting an exercise program. Your doctor can advise whether you need a modified exercise program.

For more information about cancer treatment, side effects and side effect management see our [Patient and carers](#) section.

## Where to get more information

### Telephone support

- Call Cancer Council on 13 11 20 for cancer information and support.

### Breast cancer information
