## Prostate metastatic mitozantrone and prednisolone SUPERSEDED

ID: 256 v. 6 Superseded

This protocol has been superseded as it is no longer considered best practice due to the availability of superior alternatives.

Check for clinical trials in this patient group. Link to Australian Clinical Trials website

The anticancer drug(s) in this protocol may have been included in the ADDIKD guideline. Dose recommendations in kidney dysfunction have yet to be updated to align with the ADDIKD guideline. Recommendations will be updated once the individual protocol has been evaluated by the reference committee. For further information refer to the ADDIKD guideline. To assist with calculations, use the eviQ Estimated Glomerular Filtration Rate (eGFR) calculator.

> International Consensus Guideline for Anticancer Drug Dosing in Kidney Dysfunction (ADDIKD)

## Treatment schedule - Overview

## Cycle 1 and further cycles

| Drug | Dose | Route | Day |
| :--- | :--- | :--- | :--- |
| Mitozantrone | $12 \mathrm{mg} / \mathrm{m}^{2}$ | IV | 1 |
| Prednisolone * | 5 mg TWICE a day | PO | 1 to 21 |

* prednisolone can be given as 10 mg once a day. It is given continuously during all cycles of treatment. This is often tapered off slowly over a period of 1 month after completion of chemotherapy at the discretion of the medical officer

Frequency: 21 days
Cycles: Continuous until disease progression or unacceptable toxicity

Drug status: Mitozantrone is on the PBS general schedule
Cost: $\quad \sim \$ 130$ per cycle

## Treatment schedule - Detail

The supportive therapies (e.g. antiemetics, premedications, etc.), infusion times, diluents, volumes and routes of administration, if included, are listed as defaults. They may vary between institutions and can be substituted to reflect individual institutional policy.

Antiemetics if included in the treatment schedule are based upon recommendations from national and international guidelines. These are defaults only and may be substituted to reflect individual institutional policy. Select here for recommended doses of alternative antiemetics.

Cycle 1 and further cycles

| Day 1 | 10 mg (PO) | one tablet when necessary (maximum of $30 \mathrm{mg} / 24$ <br> hours, up to 5 days) |
| :--- | :--- | :--- |
| Metoclopramide | $12 \mathrm{mg} / \mathrm{m}^{2}$ (IV) | in 50 mL sodium chloride $0.9 \%$ over 5 to 15 minutes |
| Mitozantrone |  |  |

## Day 1

Prednisolone 5 mg (PO) TWICE a day with or after food. Can be given as 10 mg ONCE a day.

| Day 2 to 21 | 5 mg (PO) | TWICE a day with or after food. Can be given as 10 mg <br> ONCE a day. |
| :--- | :--- | :--- |
| Prednisolone |  |  |

Frequency: 21 days
Cycles: Continuous until disease progression or unacceptable toxicity

## Indications and patient population

- Androgen independent (castration resistant) metastatic prostate cancer

## Clinical information

| Venous access required | IV cannula (IVC) or central venous access device (CVAD) is required to administer this treatment. <br> Read more about central venous access device line selection |
| :---: | :---: |
| Emetogenicity LOW | Suggested default antiemetics have been added to the treatment schedule, and may be substituted to reflect institutional policy. <br> Ensure that patients also have sufficient antiemetics for breakthrough emesis: <br> Metoclopramide 10 mg three times a day when necessary (maximum of $30 \mathrm{mg} / 24$ hours, up to 5 days) OR <br> Prochlorperazine 10 mg PO every 6 hours when necessary. <br> Read more about preventing anti-cancer therapy induced nausea and vomiting |
| Cumulative lifetime dose of anthracyclines | Cumulative doses should take into account all previous anthracyclines received during a patient's lifetime (i.e. daunorubicin, doxorubicin, epirubicin, idarubicin and mitoxantrone). <br> Criteria for reducing the total anthracycline cumulative lifetime dose include: <br> - patient is elderly <br> - prior mediastinal radiation <br> - hypertensive cardiomegaly <br> - concurrent therapy with high dose cyclophosphamide and some other cytotoxic drugs (e.g. bleomycin, dacarbazine, dactinomycin, etoposide, melphalan, mitomycin and vincristine). <br> Baseline clinical assessments include echocardiogram (ECHO) or gated heart pool scan (GHPS) and electrocardiogram (ECG) evaluation. <br> Patients with normal baseline cardiac function (left ventricular ejection fraction (LVEF) > 50\%) and low risk patients require LVEF monitoring when greater than $70 \%$ of the anthracycline threshold is reached or if the patient displays symptoms of cardiac impairment. Post-treatment cardiac monitoring is recommended for patients who have received high levels of total cumulative doses of anthracyclines at the clinician's discretion. <br> Read more about cardiac toxicity associated with anthracyclines |
| Corticosteroids | Diabetic patients should monitor their blood glucose levels closely. To minimise gastric irritation, advise patient to take immediately after food. Consider the use of a H 2 antagonist or proton pump inhibitor if appropriate. <br> Read more about acute short term effects from corticosteroids |

## Bone modifying agents

Blood tests
Hepatitis B screening and prophylaxis

## Vaccinations

## Fertility and fathering a child

The use of a bone modifying agent (BMA) should be considered as it may prevent skeletal related events and improve bone mineral density. Bone modifying agents include bisphosphonates (e.g. zoledronic acid and pamidronate) and the monoclonal antibody denosumab.

FBC, EUC and LFTs at baseline and prior to each treatment. INR as clinically indicated.
Routine screening for HBsAg and anti-HBc is NOT usually recommended for patients receiving this treatment.

Read more about hepatitis B screening and prophylaxis in cancer patients requiring cytotoxic and/or immunosuppressive therapy

Live vaccines are contraindicated in cancer patients receiving immunosuppressive therapy and/or who have poorly controlled malignant disease.
Refer to the recommended schedule of vaccination for immunocompromised patients, as outlined in the Australian Immunisation Handbook.

Read more about COVID-19 vaccines and cancer.
Cancer treatment can have harmful effects on fertility and this should be discussed with all patients of reproductive potential prior to commencing treatment. It is important that all patients of reproductive potential use effective contraception whilst on therapy and after treatment finishes. Effective contraception methods and contraception timeframe should be discussed with all patients of reproductive potential.

Read more about the effect of cancer treatment on fertility

## Dose modifications

Evidence for dose modifications is limited, and the recommendations made on eviQ are intended as a guide only. They are generally conservative with an emphasis on safety. Any dose modification should be based on clinical judgement, and the individual patient's situation including but not limited to treatment intent (curative vs palliative), the anti-cancer regimen (single versus combination therapy versus chemotherapy versus immunotherapy), biology of the cancer (site, size, mutations, metastases), other treatment related side effects, additional co-morbidities, performance status and patient preferences.Suggested dose modifications are based on clinical trial findings, product information, published guidelines and reference committee consensus. The dose reduction applies to each individual dose and not to the total number of days or duration of treatment cycle unless stated otherwise. Non-haematological gradings are based on Common Terminology Criteria for Adverse Events (CTCAE) unless otherwise specified. Renal and hepatic dose modifications have been standardised where possible. For more information see dosing considerations \& disclaimer .

The dose recommendations in kidney dysfunction (i.e.renal impairment) displayed may not reflect those in the ADDIKD guideline and have been included for historical reference only. Recommendations will be updated once the individual protocol has been evaluated by the reference committee, with this version of the protocol then being archived. Clinicians are expected to refer to the ADDIKD guideline prior to prescribing in kidney dysfunction.
International Consensus Guideline for Anticancer Drug Dosing in Kidney Dysfunction (ADDIKD).
Note: All dose reductions are calculated as a percentage of the starting dose

Haematological toxicity
ANC $\times 10^{9} / \mathrm{L}$ (pre-treatment blood test)

| 1.0 to less than 1.5 | Refer to local institutional guidelines; it is the view of the expert clinicians that treatment <br> should continue if patient is clinically well. |
| :--- | :--- |
| 0.5 to less than 1.0 | Delay treatment until recovery |
| less than 0.5 | Delay treatment until recovery and consider reducing mitozantrone by $25 \%$ for <br> subsequent cycles |
| Febrile neutropenia | Delay treatment until recovery and consider reducing mitozantrone by $25 \%$ for <br> subsequent cycles |

## Haematological toxicity

Platelets $\times 10^{9} / \mathrm{L}$ (pre-treatment blood test)

| 75 to less than 100 | The general recommendation is to delay, however if the patient is clinically well it may be <br> appropriate to continue treatment; refer to treating team and/or local institutional <br> guidelines. |
| :--- | :--- |
| 50 to less than 75 | Delay treatment until recovery |
| less than 50 | Delay treatment until recovery and consider reducing mitozantrone by $25 \%$ for <br> subsequent cycles |

## Renal impairment

No dose modifications necessary

Hepatic impairment
Hepatic dysfunction

| Mild | No dose modifications necessary |
| :--- | :--- |
| Moderate | Reduce mitozantrone by $25 \%$ |
| Severe | Reduce mitozantrone by $50 \%$ |

## Interactions

Drug interactions in eviQ protocols are under review and being updated to align with current literature. Further site-wide updates and changes will occur in due course. References \& Disclaimer

The drug interactions shown below are not an exhaustive list. For a more comprehensive list and for detailed information on specific drug interactions and clinical management, please refer to the specific drug product information and the following key resources:

- MIMS - interactions tab (includes link to a CYP-450 table) (login required)
- Australian Medicines Handbook (AMH) - interactions tab (login required)
- Micromedex Drug Interactions (login required)
- Cancer Drug Interactions
- Cytochrome P450 Drug Interactions

| Mitozantrone | Interaction | Clinical management |
| :--- | :--- | :--- |
| Cardiotoxic drugs (eg. bevacizumab, <br> calcium channel blockers, propranolol, <br> trastuzumab) | Increased risk of mitozantrone-induced <br> cardiotoxicity | Avoid combination or monitor closely for <br> cardiotoxicity |
| Prednisolone | Interaction | Clinical management |
| Antidiabetic agents (e.g. insulin, <br> glibenclamide, glicazide, metformin, <br> pioglitazone, etc) | The efficacy of antidiabetic agents may <br> be decreased | Use with caution and monitor blood <br> glucose |
| Azole antifungals (e.g. fluconazole, <br> itraconazole, ketoconazole, <br> posaconazole) | Increased toxicity of prednisolone <br> possible due to reduced clearance | Avoid combination or monitor for <br> prednisolone toxicity |
| Oestrogens (e.g. oral contraceptives) | Increased toxicity of prednisolone <br> possible due to reduced clearance | Avoid combination or monitor for <br> prednisolone toxicity. Dose reduction of <br> prednisolone may be required |
| Ritonavir | Increased toxicity of prednisolone | Avoid combination or monitor for <br> prednisolone toxicity |

| General | Interaction | Clinical management |
| :--- | :--- | :--- | | Warfarin | Anti-cancer drugs may alter the <br> anticoagulant effect of warfarin. | Monitor INR regularly and adjust warfarin <br> dosage as appropriate; consider <br> alternative anticoagulant. |
| :--- | :--- | :--- |
| Direct oral anticoagulants (DOACs) e.g. <br> apixaban, rivaroxaban, dabigatran | Interaction with both CYP3A4 and P-gp <br> inhibitors /inducers. <br> DOAC and anti-cancer drug levels may <br> both be altered, possibly leading to loss <br> of efficacy or toxicity (i.e. increased <br> bleeding). | Apixaban: avoid concurrent use with <br> strong CYP3A4 and P-gp inhibitors. If <br> treating VTE, avoid use with strong <br> CYP3A4 and P-gp inducers. |

## Administration

eviQ provides safe and effective instructions on how to administer cancer treatments. However, eviQ does not provide every treatment delivery option, and is unable to provide a comprehensive list of cancer treatment agents and their required IV line giving set/filter. There may be alternative methods of treatment administration, and alternative supportive treatments that are also appropriate. Please refer to the individual

## Day 1

## Approximate treatment time: $\mathbf{3 0}$ minutes

Safe handling and waste management

## Safe administration

General patient assessment prior to each day of treatment.
Any toxicity grade 2 or greater may require dose reduction, delay or omission of treatment and review by medical officer before commencing treatment.

Prime IV line(s).
Insert IV cannula or access TIVAD or CVAD.

## Pre treatment medication

Verify antiemetics taken or administer as prescribed.

## Prednisolone

- administer orally TWICE a day (morning and midday) on scheduled days
- to be taken with or after food
- prednisolone can cause sleep disturbance, if this occurs a daily morning dose is recommended.

Note: missed doses should not be replaced; if a tablet is forgotten or vomited, normal dosing should be resumed at the next scheduled dose.
© Chemotherapy - Time out

## Mitozantrone

Administer mitozantrone (irritant with vesicant properties):

- over 5 to 15 minutes
- via a minibag OR
- by IV bolus via a side port of a freely flowing IV infusion
- flush with $\sim 150 \mathrm{~mL}$ of sodium chloride $0.9 \%$.

Remove IV cannula and/or deaccess TIVAD or CVAD.
Continue safe handling precautions until 7 days after completion of drug(s)

## Discharge information

## Prednisolone tablets

- Prednisolone tablets with written instructions on how to take them.

## Antiemetics

- Antiemetics as prescribed.

Patient information

- Ensure patient receives patient information sheet.

## Side effects

The side effects listed below are not a complete list of all possible side effects for this treatment. Side effects are categorised into the approximate onset of presentation and should only be used as a guide.

## Immediate (onset hours to days)

| Blue-green urine and sclera | Blue-green discolouration of urine and occasionally the sclera may occur with mitozantrone. <br> This can last for up to 48 hours post treatment. |
| :--- | :--- |
| Nausea and vomiting | Read more about prevention of treatment induced nausea and vomiting |
| Taste and smell alteration | Read more about taste and smell changes |

Early (onset days to weeks)

| Neutropenia | Abnormally low levels of neutrophils in the blood. This increases the risk of infection. Any fever or suspicion of infection should be investigated immediately and managed aggressively. <br> Read more about immediate management of neutropenic fever |
| :---: | :---: |
| Thrombocytopenia | A reduction in the normal levels of functional platelets, increasing the risk of abnormal bleeding. <br> Read more about thrombocytopenia |
| Oral mucositis | Erythematous and ulcerative lesions of the gastrointestinal tract (GIT). It commonly develops following chemotherapy, radiation therapy to the head, neck or oesophagus, and high dose chemotherapy followed by a blood and marrow transplant (BMT). <br> Read more about oral mucositis |
| Anorexia | Loss of appetite accompanied by decreased food intake. Read more about anorexia |
| Arthralgia and myalgia | Generalised joint pain or and/or stiffness and muscle aches, often worse upon waking or after long periods of inactivity. Can improve with movement. May be mild or severe, intermittent or constant and accompanied by inflammation. <br> Read more about arthralgia and myalgia |
| Fatigue | Read more about fatigue |
| Side effects of corticosteroids | Insomnia, oedema, increased risk of infection e.g. oral thrush, gastric irritation, worsening of peptic ulcer disease, increased blood sugar levels, loss of diabetic control, mood and behavioural changes - including anxiety, euphoria, depression, mood swings, increased appetite and weight gain, osteoporosis and fractures (long term use), bruising and skin fragility are associated with corticosteroid use. |

## Late (onset weeks to months)

| Anaemia | Abnormally low levels of red blood cells (RBCs) or haemoglobin in the blood. <br> Read more about anaemia |
| :--- | :--- |
| Alopecia - partial | Hair thinning and/or patchy hair loss. Patients can also experience mild to moderate discomfort <br> of the hair follicles, and rarely pain as the hair is falling out. <br> Read more about alopecia and scalp cooling |

Delayed (onset months to years)

Anthracyclines are the most frequently implicated anti-cancer drugs associated with cardiotoxicity, which typically manifests as a reduction in left ventricular ejection fraction (LVEF), cardiomyopathy, or symptomatic CHF. Anthracycline induced cardiotoxicity has been categorised into acute, early-onset chronic progressive and late-onset chronic progressive and is usually not reversible. The risk of clinical cardiotoxicity increases with a number of risk factors including higher total cumulative doses.
Read more about cardiac toxicity associated with anthracyclines

## Evidence

Mitozantrone and hydrocortisone or prednisone have been compared in phase III trials with the steroid therapy alone. The Pivotal trial randomly assigned 161 symptomatic men with HRPC to mitozantrone $12 \mathrm{mg} / \mathrm{m}^{2}$ and prednisone 10 mg daily vs 10 mg
prednisone alone. The primary endpoint was symptom control, while secondary endpoints were duration of palliative response, PSA response and overall survival. ${ }^{1}$ The combination was associated with significantly higher pain response ( $29 \mathrm{vs} 12 \%$ ) but no benefit in PSA response or overall survival.

A confirmatory study found improvements in pain control and PSA response. . ${ }^{2}$ In a third trial of asymptomatic men the combination arm led to improved time to progression and PSA response but with no significant impact on overall survival. ${ }^{3}$

Mitozantrone has been approved as a treatment option on the basis of its symptomatic and QOL benefit. Recent data have shown improvements in survival, PSA response and symptoms with docetaxel based therapy over Mitozantrone and prednisone. ${ }^{4,5}$

## Efficacy

Mitozantrone plus corticosteroid has significant advantages in pain palliative response and median time to treatment failure over corticosteroid alone in the treatment of androgen independent prostate cancer but is associated with greater toxicity than corticosteroid alone. No survival benefit was observed from mitozantrone plus corticosteroid over corticosteroid alone.

Docetaxel (given every three weeks) has significant advantages in overall survival over mitozantrone in the treatment of androgen independent prostate cancer as first-line chemotherapy, but is associated with greater toxicity than mitozantrone.

The results of the TROPIC trial showed that for patients who progress after docetaxel-based chemotherapy, mitozantrone is inferior to cabazitaxel in terms of both overall survival and progression-free survival. ${ }^{6}$

Overall Survival curve ${ }^{2}$

© Journal of Clinical Oncology 1999

## Toxicity

The trial by Tannock et al ${ }^{4}$ reported that there was a higher incidence of cardiac events among patients who received mitozantrone. Most other types of adverse events were more frequent among patients receiving docetaxel. Table below summarises the adverse events of any grade, or of Grade 3 or 4 that occurred or worsened during treatment .

| Table 4. Adverse Events of Any Grade, or of Grade 3 or 4, That Occurred or Worsened during Treatment. |  |  |  |
| :---: | :---: | :---: | :---: |
| Adverse Event | Docetaxel Every 3 Wk ( $\mathrm{N}=332$ ) | Weekly Docetaxel ( $\mathrm{N}=330$ ) | Mitoxantrone Every 3 Wk ( $\mathrm{N}=335$ ) |
|  |  | percent |  |
| Grade 3 or 4 anemia | 5 | 5 | 2 |
| Grade 3 or 4 thrombocytopenia | 1 | 0 | 1 |
| Grade 3 or 4 neutropenia | 32* | $2 \dagger$ | 22 |
| Febrile neutropenia | 3 | 0 | 2 |
| Impaired LVEF : | $10 \dagger$ | $8 \dagger$ | 22 |
| Major decrease | $1 \dagger$ | 2* | 7 |
| Fatigue | $53 \dagger$ | $49 \dagger$ | 35 |
| Grade 3 or 4 | 5 | 5 | 5 |
| Alopecia | $65 \dagger$ | 50才 | 13 |
| Nausea, vomiting, or both | 42 | 41 | 38 |
| Diarrhea | $32 \dagger$ | 34 $\dagger$ | 10 |
| Nail changes | $30 \dagger$ | $37 \dagger$ | 7 |
| Sensory neuropathy | $30 \dagger$ | 24\% | 7 |
| Anorexia | 17 | 21* | 14 |
| Change in taste | $18 \dagger$ | 24 ${ }^{\text {\% }}$ | 7 |
| Stomatitis | $20 \dagger$ | $17 \dagger$ | 8 |
| Myalgia | 14 | 14 | 13 |
| Dyspnea | 15* | 14* | 9 |
| Tearing | $10 \dagger$ | 21† | 1 |
| Peripheral edema | 19† | 12† | 1 |
| Epistaxis | 6 | $17 \dagger$ | 2 |
| $\geq 1$ Serious adverse event | 26 | 29 | 20 |
| Treatment-related death | 0.3 | 0.3 | 1 |

* $\mathrm{P} \leq 0.05$ by Fisher's exact test for the comparison with the mitoxantrone group.
$\dagger P \leq 0.0015$ by Fisher's exact test for the comparison with the mitoxantrone group. A Bonferroni adjustment for multiplicity was used to obtain the nominal significance level of 0.0015 (approximately $0.05 \div 34$ ), on the basis of two tests being carried out on the 17 adverse events, with at least 20 events in at least one of the three treatment groups.
A major decrease in the left ventricular ejection fraction (LVEF) was defined as a decrease of at least 10 percent in the absolute value to below the lower limit of the normal range.

## Patient information - Prostate cancer metastatic Mitozantrone and prednisolone

## Patient's name:

## Your treatment

The treatment schedule below explains how the drugs for this treatment are given.

| Mitozantrone and prednisolone |  |  |  |
| :---: | :--- | :--- | :--- |
| This treatment cycle is repeated every 21 days. Your doctor will advise you of the number of treatments you will have. |  |  |  |
| Day | Treatment | How it is given | How long it takes |
| 1 | Mitozantrone <br> (mye-toe-ZAN-trone) | By a drip into a vein | About 30 minutes |
| continuously | Prednisolone <br> (pred-NIS-oh-lone) | Taken orally with or after food. If you forget to take a tablet or vomit a <br> tablet, take your normal dose the next time it is due. Do not take an extra <br> dose. |  |

## When to get help

Anticancer drugs (drugs used to treat cancer) can sometimes cause serious problems. It is important to get medical help immediately if you become unwell.

## IMMEDIATELY go to your nearest hospital Emergency Department, or contact your doctor or nurse if you have any of the following at any time:

- a temperature of $38^{\circ} \mathrm{C}$ or higher
- chills, sweats, shivers or shakes
- shortness of breath
- uncontrolled vomiting or diarrhoea
- pain, tingling or discomfort in your chest or arms
- you become unwell.

## Emergency contact details

Ask your doctor or nurse from your treating team who to contact if you have a problem

Daytime:
Night/weekend:
Other instructions: $\qquad$
$\qquad$

During your treatment immediately tell the doctor or nurse looking after you if you get any of the following problems:

- leaking from the area where the drugs are being given
- pain, stinging, swelling or redness in the area where the drugs are being given or at any injection sites
- a skin rash, itching, feeling short of breath, wheezing, fever, shivers, or feeling dizzy or unwell in any way (allergic reaction).

Other information about your treatment

## Changes to your dose or treatment delays

Sometimes a treatment may be started at a lower dose or the dose needs to be changed during treatment. There may also be times when your treatment is delayed. This can happen if your doctor thinks you are likely to have severe side effects, if you get severe side effects, if your blood counts are affected and causing delays in treatment, or if you are finding it hard to cope with the treatment. This is called a dose reduction, dose change or treatment delay. Your doctor will explain if you need any changes or delays to your treatment and the reason why.

## Blood tests and monitoring

Anti-cancer drugs can reduce the number of blood cells in your body. You will need to have regular blood tests to check that your blood cell count has returned to normal. If your blood count is low, your treatment may be delayed until it has returned to normal. Your doctor or nurse will tell you when to have these blood tests.

## Other medications given during this treatment

- Anti-sickness (anti-nausea) medication: you may be given some anti-sickness medication. Make sure you take this medication as your doctor or nurse tells you, even if you don't feel sick. This can help to prevent the sickness starting.

## Superseded treatments

This treatment is superseded meaning that better treatments have taken its place. Uncommonly superseded treatments are still used. Your doctor will explain why this treatment has been selected for you.

## Side effects

Cancer treatments can cause damage to normal cells in your body, which can cause side effects. Everyone gets different side effects, and some people will have more problems than others.

The table below shows some of the side effects you may get with this treatment. You are unlikely to get all of those listed and you may also get some side effects that have not been listed.

Tell your doctor or nurse about any side effects that worry you. Follow the instructions below and those given to you by your doctor or nurse.

| Immediate (onset hours to days) |  |
| :---: | :---: |
| Urine and whites of the eyes turning blue/green | - Your urine and the whites of your eyes may change colour during mitozantrone treatment. <br> - This may last for up to 48 hours after your treatment but is not harmful. |
| Nausea and vomiting | - You may feel sick (nausea) or be sick (vomit). <br> - Take your anti-sickness medication as directed even if you don't feel sick. <br> - Drink plenty of fluids (unless you are fluid restricted). <br> - Eat small meals more frequently. <br> - Try food that does not require much preparation. <br> - Try bland foods like dry biscuits or toast. <br> - Gentle exercise may help with nausea. <br> - Ask your doctor or nurse for eviQ patient information - Nausea and vomiting during cancer treatment. <br> - Tell your doctor or nurse immediately, or go to the nearest hospital Emergency Department if you have uncontrolled vomiting or feel dizzy or light-headed. |
| Taste and smell changes | - You may find that food loses its taste or tastes different. <br> - These changes are likely to go away with time. <br> - Do your mouth care regularly. <br> - Chew on sugar-free gum or eat sugar-free mints. <br> - Add flavour to your food with sauces and herbs. <br> - Ask your doctor or nurse for eviQ patient information - Taste and smell changes during cancer treatment. |

## Early (onset days to weeks)

## Infection risk (neutropenia)

## Low platelets

(thrombocytopenia)

Mouth pain and soreness (mucositis)

## Appetite loss (anorexia)

- This treatment lowers the amount of white blood cells in your body. The type of white blood cells that help to fight infection are called neutrophils. Having low level of neutrophils is called neutropenia. If you have neutropenia, you are at greater risk of getting an infection. It also means that your body can't fight infections as well as usual. This is a serious side effect, and can be life threatening.
- Wash your hands often.
- Keep a thermometer at home and take your temperature regularly, and if you feel unwell.
- Do your mouth care regularly.
- Inspect your central line site (if you have one) daily for any redness, pus or swelling.
- Limit contact with people who are sick.
- Learn how to recognise the signs of infection.
- Ask your doctor or nurse for eviQ patient information - Infection during cancer treatment.
- Tell your doctor or nurse immediately, or go to the nearest hospital Emergency Department if you get any of the following signs or symptoms:
- a temperature of $38^{\circ} \mathrm{C}$ or higher
chills, shivers, sweats or shakes
- a sore throat or cough
- uncontrolled diarrhoea
- shortness of breath
- a fast heartbeat
- become unwell even without a temperature.
- This treatment lowers the amount of platelets in your blood. Platelets help your blood to clot. When they are low, you are at an increased risk of bleeding and bruising.
- Try not to bruise or cut yourself.
- Avoid contact sport or vigorous exercise.
- Clear your nose by blowing gently.
- Avoid constipation.
- Brush your teeth with a soft toothbrush.
- Don't take aspirin, ibuprofen or other similar anti-inflammatory medications unless your doctor tells you to.
- Tell your doctor or nurse if you have any bruising or bleeding.
- Tell your doctor or nurse immediately, or go to your nearest hospital Emergency Department if you have any uncontrolled bleeding.
- You may have:
- bleeding gums
- mouth ulcers
- a white coating on your tongue
- pain in the mouth or throat
- difficulty eating or swallowing.
- Avoid spicy, acidic or crunchy foods and very hot or cold food and drinks.
- Try bland and soft foods.
- Brush your teeth gently with a soft toothbrush after each meal and at bedtime. If you normally floss continue to do so.
- Rinse your mouth after you eat and brush your teeth, using either:
- $1 / 4$ teaspoon of salt in 1 cup of warm water, or
- 1/4 teaspoon of bicarbonate of soda in 1 cup of warm water
- Ask your doctor or nurse for eviQ patient information - Mouth problems during cancer treatment.
- Tell your doctor or nurse if you get any of the symptoms listed above.
- You may not feel like eating.
- Try to avoid drinking fluids at meal times.
- Try to eat small meals or snacks regularly throughout the day.
- Try to eat food that is high in protein and calories.
- If you are worried about how much food you can eat, or if you are losing weight, ask to speak to a dietitian.

## Joint and muscle pain and stiffness

Tiredness and lack of energy (fatigue)

Side effects from steroid medication

- You may get muscle, joint or general body pain and stiffness.
- Applying a heat pack to affected areas may help.
- Talk to your doctor or nurse about other ways to manage these symptoms. You may need medication to help with any pain.
- You may feel very tired, have no energy, sleep a lot, and not be able to do normal activities or things you enjoy.
- Do not drive or operate machinery if you are feeling tired.
- Nap for short periods (only 1 hour at a time)
- Prioritise your tasks to ensure the best use of your energy.
- Eat a well balanced diet and drink plenty of fluids (unless you are fluid restricted).
- Try some gentle exercise daily.
- Allow your friends and family to help.
- Tell your doctor or nurse if you get any of the symptoms listed above.
- Steroid medication may cause:
- mood swings and behaviour changes
- an increased appetite
- weight gain
- swelling in your hands and feet
- stomach upsets
- trouble sleeping
- fragile skin and bruising
- an increase in your blood sugar level
- weak and brittle bones (osteoporosis)
- Take your steroid medication with food to reduce stomach upset
- If you have diabetes, your blood sugar levels may be tested more often.
- Tell your doctor or nurse if you get any of the symptoms listed above.

## Low red blood cells

(anaemia)

- You may feel dizzy, light-headed, tired and appear more pale than usual.
- Tell your doctor or nurse if you have any of these signs or symptoms. You might need a blood transfusion.
- Tell your doctor or nurse immediately, or go to the nearest hospital Emergency Department if you have any chest pain, trouble breathing, or feel like your heart is racing.
- Your hair may become dry and may break easily.
- You may lose some of your hair.
- Use a gentle shampoo and a soft hairbrush.
- Take care with hair products like hairspray, hair dye, bleaches and perms.
- Protect your scalp from the cold with a hat or scarf.
- Protect your scalp from the sun with a hat and sunscreen of SPF 50 or higher.
- Ask your doctor or nurse about the Look Good Feel Better program (www.lgfb.org.au)

## Delayed (onset months to years)

## Heart problems

- You may get:
- chest pain or tightness
- shortness of breath
- swelling of your ankles
- an abnormal heartbeat.
- Heart problems can occur months to years after treatment.
- Tell your doctor if you have a history of heart problems or high blood pressure.
- Before or during treatment, you may be asked to have a test to see how well your heart is working.
- Tell your doctor or nurse immediately, or go to the nearest hospital Emergency Department if you get any of the symptoms listed above.

## Chemotherapy safety

- Learn how to keep you and your family safe while you are having anticancer drugs.
- See our patient information sheet - Chemotherapy safety at home.

## Blood clot risk

- Cancer and anticancer drugs can increase the risk of a blood clot (thrombosis).
- Tell your doctor if you have a family history of blood clots.
- A blood clot can cause pain, redness, swelling in your arms or legs, shortness of breath or chest pain.
- If you have any of these symptoms go to your nearest hospital Emergency Department.

## Medications and vaccinations

- Before you start treatment, tell your doctor about any medications you are taking, including vitamins or herbal supplements.
- Don't stop or start any medications during treatment without talking to your doctor and pharmacist first.
- Paracetamol is safe to take if you have a headache or other mild aches and pains. It is recommended that you avoid taking aspirin, ibuprofen and other anti-inflammatory type medications for pain while you are having treatment. However, if these medications have been prescribed by your doctor, do not stop taking them without speaking with your doctor.
- Vaccinations such as flu and tetanus vaccines are safe to receive while having treatment. Do not have any live vaccines during your treatment or for 6 months after it finishes. If you are unsure, check with your doctor before you have any vaccinations.
- People you live with should be fully vaccinated, including having live vaccines according to the current vaccination schedule. Extra care needs to be taken with hand washing and careful disposal of soiled nappies for infants who have recently received the rotavirus vaccine.

## Other medical and dental treatment

- If you go to hospital or any other medical appointment (including dental appointments), always tell the person treating you that you are receiving anticancer drugs.
- Before you have any dental treatment, talk to your doctor.

## Diet

- While you are receiving this treatment it is important that you try to maintain a healthy diet.
- Speak to your doctor or nurse about whether drinking alcohol is safe with your treatment.
- If you have any concerns about recent weight loss or weight gain or questions about your diet, ask to speak to a dietitian.

## Fertility

- Some cancer treatments can reduce your fertility. This can make it difficult or impossible to father a child.
- Talk to your doctor or nurse before you start any treatment. Depending on your situation there may be fertility sparing options available to you and/or your partner, discuss these with your doctor or nurse.

## Fathering a child

- Some cancer treatments can be dangerous to unborn babies. Talk to your doctor or nurse if you think there is any chance that your partner could be pregnant.
- Do not try to father a child during this treatment. Contraception should be used during treatment and after stopping treatment. Ask your doctor or nurse about what type of contraception you should use.
- If you are planning fatherhood after completing this treatment, talk to your doctor. Some doctors advise waiting between 6 months and 2 years after treatment.

## Sex life and sexuality

- The desire to have sex may decrease as a result of this treatment or its side effects.
- Your emotions and the way you feel about yourself may also be affected by this treatment.
- It may help to discuss your concerns with your partner and doctor or nurse.

## Quitting smoking

- It is never too late to quit smoking. Quitting smoking is one of the best things you can do to help your treatment work better.
- There are many effective tools to improve your chances of quitting.
- Talk to your treating team for more information and referral to a smoking cessation support service.

## Staying active

- Research shows that exercise, no matter how small, has many benefits for people during and after cancer treatment.
- Talk to your doctor before starting an exercise program. Your doctor can advise whether you need a modified exercise program.

For more information about cancer treatment, side effects and side effect management see our Patient and carers section.

## Where to get more information

## Telephone support

- Call Cancer Council on 131120 for cancer information and support

## Prostate cancer information

- Continence Foundation of Australia - continence.org.au
- Healthy Male Andrology Australia - healthymale.org.au
- National Continence Management Strategy - bladderbowel.gov.au/ncp/ncms
- National Public Toilet Map - toiletmap.gov.au
- Prostate Cancer Foundation of Australia - prostate.org.au
- South Australian Prostate Cancer Clinical Outcome Collaborative - prostatehealth.org.au
